

## eFacility®

At British Sugar we are using eFacility® to manage and share monitoring data, site maps and documents for most of our facilities.

eFacility® is an extranet application which integrates environmental data and GIS based maps providing us with a centrally managed, web-based, working environment.

It also lets us more efficiently manage our PPC (EP) responsibilities, including the documentation, maps and laboratory data from site characterisation work, for both our active factories and for sites entering the decommissioning phase.

Data are collected from the field, merged with the laboratory analysis and validated before publication to give us quality data and information for graphing, further analysis and reporting.

Amongst other benefits, eFacility® collation and review of different spreadsheets from a number of different sites.

It has also proved a great time saver with information at our finger tips to provide quick answers both internally and externally to questions relating to the environmental data. And because of its web-based availability we can give controlled access to relevant individuals and parties so that they can easily search for information themselves, offering even more efficiency.

The performance of eFacility® has matched expectations and we look forward to its ongoing delivery of strong business values.
