

eFacility[®] –managing the Council’s landfill sites’ spatial data

"At CCC we carry out regular environmental monitoring at our closed landfill sites generating a large volume of data. Prior to our use of eFacility the monitoring data was stored in spreadsheets where the data could be easily corrupted.

In 2006 we decided to invest in a system that allowed the capturing, storing and analysis of data on sites and associated documentation.

One Touch Data stood out from other suppliers as providing a service instead of just software which from experience I have found to be friendly and efficient. eFacility enables us to securely store our environmental data with the ability to group and graph data for easy and quick analysis.

An important benefit is centralisation of all data and relevant documentation and reports which not only saves time but gives peace of mind – in such a large organisation I would not like to have to find anything in our archive stores!

As eFacility is run through Microsoft Internet Explorer we can also customise limited access to the data to third party contractors by providing them with a unique username and password saving on time and money.

Overall, eFacility offers us a bespoke service to enable us to carry out our work more efficiently."

Best Regards
